

Assessment of Šárka Sučková

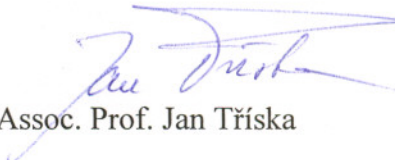

Šárka Sučková started her bachelor thesis in the Laboratory of Analytical Chemistry ISBE, CAS, CR, v.v.i. according the Appliance protocol in May 2009. The subject of the thesis "Occurrence of brominated diphenylethers in the environment and their biological activity" is topical and it is connected to the field of Environmental Chemistry.

During the elaboration of the thesis she has been working independently and purposefully. She has also a very good knowledge of English, so that she has been studied number of the literature references without any problems. Certain lack of her work was that Šárka had to develop her thesis in very short time. She had limited time space due to examinations. Therefore she came into contact with me as supervisor shortly before delivery of the thesis, but she surprised me finally pleasantly with the quality of her work. Despite this self-inflicted time handicap Šárka was very successful in preparing her thesis and she studied a number of literary references in addition. I intended originally as a supervisor of Šárka's thesis to acquaint her also with the preparation, determination and evaluation of PBDEs analysis in our laboratory, but due to a critical shortage of time, this intended part of the work was not executed. As a conclusion I can

fully recommend

the bachelor thesis of Šárka Sučková for the defence.
