Sedláček, J., 2021: Green and blue infrastructure: means of reducing surface temperatures in the urban environment. RNDr. Thesis, in English. – 27 p., Faculty of Science, University of South Bohemia, České Budějovice, Czech Republic.

Abstract

Climate change may accelerate the Urban Heat Island (UHI) effect with many consequences for the well-being of human populations in cities. Green and blue infrastructures (GBI) are presented as a way to mitigate the UHI effect. In our study, the influence of GBI (primarily less studied types) on surface temperature (ST) was tested using a thermal camera. Various types of GBI (e. g. tree shade and lawn) and their combination were compared.

Declaration (in Czech)

Prohlašuji, že jsem autorem této kvalifikační práce (v rámci podílu specifikovaného na stránce o spoluautorství) a že jsem ji vypracoval pouze s použitím pramenů a literatury uvedených v seznamu použitych zdrojů.

V Rokycanech, dne 13. 9. 2021

Podpis studenta

Declaration: Participation of each co-author (in Czech)

Podíl jednotlivých autorů na této práci byl následující:

Jan Sedláček:

- sběr a zpracování dat (zeleň)
- tvorba grafů a tabulek
- psaní literární rešerše
- psaní výsledků a diskuze
- zpracování připomínek
- odeslání práce a korespondence s časopisem

Martin Hais:

- zajištění termální kamery a její technické nastavení
- zajištění programů a skriptu pro zpracování dat
- dohled nad celou prací, psaní připomínek

Kristýna Pouchová:

- sběr a zpracování dat (vodní prvky)
- asistence u literární rešerše

Kristýna Pouchová

Acknowledgement

I would like to thank to Milan Novák for adapting the thermal camera for manual data acquisition. Many thanks also to Christopher Steer and Keith Edwards for the language correction.

Abstract

Climate change may accelerate the Urban Heat Island (UHI) effect with many consequences for the well-being of human populations in cities. Green and blue infrastructures (GBI) are presented as a way to mitigate the UHI effect. In our study, the influence of GBI (primarily less studied types) on surface temperature (ST) was tested using a thermal camera. Various types of GBI (e. g. tree shade and lawn) and their combination were compared. The studied GBI, including less common forms such as containers with ornamental plants, green roofs and fountains, reduced daytime ST. Moreover, they reduced the thermal amplitudes of surrounding areas (up to 30 m). The results imply that besides larger GBI (e.g. parks, rivers) smaller structures may significantly decrease the UHI effect. We recommend a combination of both blue and green structures especially in street canyons and the use of green roofs and walls when the space for adding GBI is limited.

The article (Green and blue infrastructure: means of reducing surface temperatures in the urban environment) was accepted and will be published in International Journal of Environment and Sustainable Development (Publisher: Inderscience Enterprises Ltd; ISSN 14787466)
